Keywords: Biodiversity; Floristic; Tamil Nadu; Udumalpet Taluk; Urbanisation.

Abstract

Survey on the floral diversity is an important activity to assess the existing flora. This study was carried out from December 2017 to December 2018 to document the flora existing in the Udumalpet Taluk, Tiruppur District, Tamil Nadu, India. As a result, a total of 370 taxa belonging to 263 genera of 82 angiosperm families have been documented. 52% of species of them are herbaceous. Euphorbiaceae and Fabaceae with 23 taxa each, Asteraceae with 21 species, Acanthaceae with 20 species and Amaranthaceae with 18 species are observed as the dominant families. In this article, family, botanical name, habit, vernacular name and various applications of the recorded plants are enumerated systematically. Threats to these plants and possible conservation strategies are also discussed briefly.

Introduction

Flora of a region is considered as an essential part of the environment that determines the wealth of ecosystem and human health (Sandifer *et al.*, 2015). It is highly recommended that, proper utilization of plant resources of a country, state, district, small areas like taluks and villages, has been helpful to maintain the availability and richness of the flora (Gurusamy *et al.*, 2016; Sarvalingam and Rajendran, 2018). Documentation on the flora of rural areas are comparatively less than the checklists of flora on the particular hills, green patches, reserve forests, uphill or otherwise focused on particular group of plants or genus of the family etc. (Singh, 1982; Sinha, 2005; Sukumaran *et al.*, 2008; Mantosh 2013; Vijay and Ashok, 2013; Ganorkar and Kshirsagar, 2013; Kumar and Ritesh, 2014; Anuradha and Murugandam, 2016; Parthipan *et al.*, 2016; Savita and Sanjaykumar, 2017).

Udumalpet Taluk was previously included in the Coimbatore district, after the bifurcation on 2008, it came under newly formed Tiruppur district. Floristic survey of this area was previously done by different researchers mainly on Anamalai Reserve Forests and its nearby reserve forests, green patches and hillocks coming under this Taluk. However, Thirumoorthy and Amaravathi dams flora was not done extensively (Shankaranarayanan and Gupta, 1959; Balasubramanian *et al.*, 1997; Ramachandran, 2007; George *et al.*, 2011; Rasingam, 2012; Ramachandran *et al.*, 2014; Murugeswaran *et al.*, 2014; Rajendran *et al.*, 2014; Sridharan and Kalpana, 2017). Since the inhabitants of these areas still rely on plants for medicinal, edible and other commercial/miscellaneous uses, the present work focused to explore the flora existing in the rural areas of Udumalpet Taluk by conducting frequent field surveys and assess its conservation status.

Materials and Methods

Udumalpet Taluk of Tiruppur District, Tamil Nadu (India) lies between 10°24' 23"N latitude and 77°24' 45"E longitude. The average altitude of the study area is 368 m. Annual temperature varies from an average of 20°C and 38°C and the average annual rainfall is 480 to 600 mm. Total population of the Udumalpet Taluk is 1,29,117 of which 64,600 are male and 64,517 are female from 46 villages. Banana, Coconut, Maize, yellow Pumpkin are the main crops cultivated in the study area.

This area is surrounded by a part of Anamalai hills and two major reservoirs namely, Thirumoorthy Dam and Amaravathi Dam, a part of Indira Gandhi Wildlife Sanctuary and National Park (now Anamalai Tiger Reserve) of Western Ghats crossing Tamil Nadu. Floristic survey of this region was previously done by different researchers mainly on Anamalai Reserve Forests and its nearby reserve forests. No records are found in the Rural floras (George *et al.*, 2011; Rasingam, 2012; Murugeswaran *et al.*, 2014; Rajendran *et al.*, 2014; Sridharan and Kalpana, 2017).

For this study, frequent field explorations were conducted from December 2017 to December 2018 to document the flora existing in the different habitats in the rural areas of Udumalpet Taluk. Specimens were collected in triplicate and identified using various flora (Gamble and Fischer, 1915-1936; Nair and Henry, 1983; Henry *et al.*, 1987, 1989; Chandrabose and Nair, 1987; Matthew, 1981-1983, 1991). The botanical name and vernacular name were verified using reputed websites such as The Plant List (2013), FRLHT etc. The collected plant specimens were processed for herbarium as per the standard herbarium methods (Jain and Rao, 1977) and deposited in the herbaria of Siddha Clinical Research Unit, Palayamkottai for future reference.

Results and Discussion

A total of 370 taxa belonging to 263 genera spreading over 82 families of Angiosperms along with some species of Pteridophytes such as *Selaginella wightii* Hieron., *Marsilea quadrifolia* L., *Actinopteris radiata* (J. Koenig ex Sw.) Link, *Azolla* sp. etc., bryophytes such as *Marchantia* sp., *Funararia* sp. and a few fungus were documented. In Dicotyledons, the sub-class Polypetalae comprises 38 families of 103 genera with 147 species, Gamopetalae 18 families of 99 genera and 134 species, and Monochlamydeae 14 families of 36 genera 63 species, whereas Monocotyledon 12 families of 25 genera with 26 species (Table 1). Each taxon is enumerated with botanical name, family, habit, vernacular name and economic importance such as medicine, edible, ornamental and timber yielding plants (Table 2).

Euphorbiaceae and Fabaceae are dominant with 23 species each followed by Asteraceae (21 species), Acanthaceae (20 species), Amaranthaceae (18 species), Caesalpiniaceae (16 species), Solanaceae (15 species), Malvaceae (13 species), Cucurbitaceae and Mimosaceae (12 species each), Verbenaceae and Lamiaceae (10 species each) and rest of the families comprise less than ten species each (Fig. 1). The habit of the species recorded from the study area is broadly classified under four categories *viz.*, herbs, shrubs, climbers and trees. Herbs constitute the major portion with 196 species (53%) followed by trees with 82 species (22%), shrubs with 53 (15%) and climbers with 38 species (10%). The tree species such as, *Adenanthera pavonina* L., *Alstonia scholaris* (L.) R.Br., *Ailanthus excelsa* Roxb., *Crateva adansonii* DC., *Dalbergia sissoo* Roxb., *Delonix elata* (L.) Gamble, *Delonix regia* (Boj. ex Hook) Rafin., *Lannea coromandelica* (Houtt.) Merr., *Millingtonia hortensis* L.f., *Azadirachta indica* A. Juss., *Muntingia calabura* L., *Pongamia pinnata* (L.) Pierre, *Spathodea campanulata* Beauv., *Tamarindus indica* L., *Tectona grandis* L.f., *Terminalia arjuna* (Roxb.) Wight & Arn., *Terminalia catappa* L., and *Thespesia populnea* (L.) Soland ex Correa are recorded from the roadsides/highways. Some of the common species recorded in the study area were given in the Figs 2 and 3.

Amongst the recorded plants, 332 (75.11%) species are medicinal, 48 (10.85%) species are edible, 30 (6.78%) species are timber yielding, and 27 species (6.10%) are ornamentals. Five species are useful in miscellaneous purposes (1.13%). The common seasonal herbs of annuals, biennials, climbers and aquatic species are flourished in the studied area that has been used as medicine for common ailments. However, some interesting species such as *Caralluma umbellata* Haw., *Cymbopogon citratus* (DC.) Stapf., *Dodonaea viscosa* (L.) Jacq. and *Euphorbia antiquorum* L. etc., are found to be dominant along with the other medicinal plants in the small hillocks like Perumalmalai, Thamburamalai and Perumalpudhur hills.

Species like *Ammania baccifera* L., *Bacopa monnieri* (L.) Pennell, *Centella asiatica* (L.) Urban, *Colocasia esculenta* (L.) Schott, *Commelina benghalensis* L., *Cyanotis axillaris* (L.) D. Don, *Eichhornia crassipes* (Mart.) Solms-Laub., *Pistia stratiotes* L., *Sphaeranthus amaranthoides* Burm.f. and *Sphaeranthus indicus* L. are recorded from the wetlands. *Dendrophthoe falcata* (L.f.) Etting. a stem parasite, *Striga asiatica* (L.) Kuntze and *Santalum album* L., the root parasites are also found in the study area. *Strobilanthes consanguineaus* (Nees) T. Anders. is an endemic species of the Southern Western Ghats (Sasidharan, 2004). *Santalum album* L. (Santalaceae) is recorded as rare during the study period (IUCN, 2018). *Eichhornia crassipes* (Mart.) Solms-Laub., *Lantana camara* L. var. *aculeata* (L.) Mold., *Mikania cordata* (Burm.f.) B.L.Rob. and *Parthenium hysterophorus* L. are the exotics species spreading vigorously in the natural habitations and cultivation fields that compete with other important taxa.

Table 1. Numerical representation of the flora of Udumalpet Taluk, Tiruppur District.

Class	Sub-class	No. of species	No. of genera	No. of families
Dicotyledons	Polypetalae	147	103	38
	Gamopetalae	134	99	18
	Monochlamydeae	63	36	14
Monocotyledons	-	26	25	12
Total		370	263	82

Urbanisation affects the natural flora and fauna that imposes to document the existing biodiversity that enable to conserve them from the extinction (Dolan *et al.*, 2011). The flora and ecosystem of this region are facing serious threats due to the increased anthropogenic activities. Natural flora of Udumalpet taluk of Tiruppur district are facing serious threats especially because of the growing attention of its tourist places, such as Tirumooorthy hills, Amaravathy dam, Anamalai tiger reserve etc., and due to the constructions of new inns, hotels, and extension of roads etc. It has been noted that, a number of timber yielding and medicinally important trees such as Neem (*Azadirachta indica* A. Juss.), Tamarind (*Tamarindus indica* L.), Gulmohar (*Delonix regia* (Boj. ex Hook) Rafin.) are uprooted for road construction and highway extension programmes. Frequent documentation are done on the flora of the protected areas (Shankaranarayanan and Gupta, 1959; Vajravelu and Joesph, 1971; Balasubramanian *et al.*, 1997; Fischer, 2004; Rasingam, 2012; Murugeswaren *et al.*, 2014; Ramachandran *et al.*, 2014; Sarvalingam and Rajendran, 2018), but little attention is given to the flora of rural and aboriginal areas that are under different threats. Urbanization, habitat fragmentation, anthropological pressures, and pollution are the profound reasons for the destruction of the natural vegetation in the rural and aboriginal areas which is considered as an important component of the healthy environment.

In Tiruppur District, Udumalpet Taluk is the main source of electricity generated through wind mills and wind turbines. The occurrence of wind mills, affect the natural vegetation as well as cultivated fields. Thus, documentation of the existing flora of Udumalpet taluk will be helpful for conservation of its important natural plant resources.

Acknowledgements

The authors are thankful to the Director General, Central Council for Research in Siddha (Ministry of AYUSH, Govt. of India) Chennai for the constant encouragement and thankful to CCRS for sanctioning and granting the IMR Project. We also acknowledge the In-charge of SCRU, Palayamkottai for her constant encouragement and support. We thank to Mr. C.Maharaja and K.Karthik Field Assistants for their service during field surveys.
