

MAPPINGS IN FUZZY HAUSDORFF SPACES IN QUASI-COINCIDENCE SENSE

SAIKH SHAHJAHAN MIAH^{1*} AND MD. RUHUL AMIN

Department of Mathematics, Faculty of Science, Begum Rokeya University, Rangpur, Rangpur-5404, Bangladesh

ABSTRACT

In this paper, we introduce two notions of property in fuzzy topological spaces by using quasi-coincidence sense and we establish relationship among our and other such notions. We also show that all these notions satisfy good extension property. Also hereditary, productive and projective properties are satisfied by these notions. We observe that all these concepts are preserved under one-one, onto, fuzzy open and fuzzy continuous mappings. Finally, we discuss initial and final fuzzy topologies on our second notion.

Key words: Fuzzy Topological Space, Quasi-coincidence, Fuzzy Hausdorff Topological Spaces, Good Extension, Mappings

INTRODUCTION

Chang (1968) defined fuzzy topological spaces by using fuzzy sets introduced by Zadeh (1965). Since then extensive work on fuzzy topological spaces has been carried out by many researchers like Gouguen (1973), Wong (1974), Warren (1974), Hutton (1975), Lowen (1976), and others. Fuzzy Hausdorff (topologicalspace has been already introduced in the literature. There are many articles on fuzzy topological space which are created by many authors like Wuyts and Lowen (1983), Srivastava *et al.* (1981), Ali (1990) and others.

The purpose of this paper is to further contribute to the development of fuzzy topological spaces especially on fuzzy topological spaces. In the present paper, fuzzy topological space is defined by using quasi-coincidence sense and it is showed that the good extension property is satisfied by our notions. In the next section of this paper, it is also shown that the hereditary, order preserving, productive, and projective properties hold on the new concepts. Finally, we discuss initial and final fuzzy topologies on our second notion.

PRELIMINARIES

In this section, we recall some concepts occurring in the cited papers which will be needed in the sequel. In the present paper X and Y always denote non-empty sets.

Definition: A function u from X into the unit interval I is called a fuzzy set in X . For every $x \in X$ is called the grade of membership of x in u . Some authors say that u is a fuzzy subset of X instead of saying that u is a fuzzy set in X . The class of all fuzzy sets from X into the closed unit interval I will be denoted by $\mathcal{F}(X)$ (Zadeh 1965).

Definition: A fuzzy set u in X is called a fuzzy singleton if and only if $u(x) = 1$ for a certain $x \in X$ and $u(y) = 0$ for all points y of X except x . The fuzzy singleton is denoted by δ_x and x is its support. The class of all fuzzy singletons in X will be denoted by $\mathcal{S}(X)$. If u and v are fuzzy singletons, then we say that u and v are coincident if and only if $u = v$ (Ming 1980).

Definition: A fuzzy set u in X is called a fuzzy point if and only if, for a certain $x \in X$ and $\alpha \in (0, 1]$ for all points y of X except x . The fuzzy point is denoted by αx and x is its support (Wong 1974).

Definition: A fuzzy singleton δ_x is said to be quasi-coincidence with u , denoted by $\delta_x \text{ q.c. } u$ if and only if $u(x) > 0$. If δ_x is not quasi-coincidence with u , we write $\delta_x \not\text{q.c. } u$ and defined as (Kandil 1991).

Definition: Let f be a mapping from a set X into a set Y and u be a fuzzy subset of X . Then f and u induce a fuzzy subset v of Y defined by

$$v(y) = \begin{cases} u(x) & \text{if } y = f(x) \\ 0 & \text{otherwise} \end{cases} \quad (\text{Chang 1968}).$$

Definition: Let f be a mapping from a set X into a set Y and v be a fuzzy subset of Y . Then the inverse of v written as $f^{-1}(v)$ is a fuzzy subset of X defined by $f^{-1}(v)(x) = v(f(x))$, for $x \in X$ (Chang 1968).

Definition: Let $I = [0, 1]$, X be a non empty set and $\mathcal{F}(X)$ be the collection of all mappings from X into I , i.e. the class of all fuzzy sets in X . A fuzzy topology on X is defined as a family τ of members of $\mathcal{F}(X)$, satisfying the following conditions.

- (i) $\emptyset \in \tau$ and $X \in \tau$.
- (ii) If for each $U_i \in \tau$, then $\bigcap U_i \in \tau$, where Λ is an index set.
- (iii) If $U \in \tau$ then $\bigcup U \in \tau$.

The pair (X, τ) is called a fuzzy topological space (in short fts) and members of τ are called τ -open fuzzy sets. A fuzzy set v is called a τ -closed fuzzy set if $v \in \tau$ (Chang 1968).

Definition: The function f is called fuzzy continuous if and only if for every $U \in \tau$, the function f is called fuzzy homeomorphic if and only if f is bijective and both f and f^{-1} are fuzzy continuous (Ming 1980).

Definition: The function f is called fuzzy open if and only if for every open fuzzy set u in X is open fuzzy set in (Y, s) (Malghan 1984).

Definition: If u and v are two fuzzy subsets of X and Y respectively then the Cartesian product of two fuzzy subsets u and v is a fuzzy subset of $X \times Y$ defined by $(u \times v)(x, y) = \min\{u(x), v(y)\}$, for each pair $(x, y) \in X \times Y$ (Azad 1981).

Definition: Let $\{X_i, i \in \Lambda\}$, be any class of sets and let X denotes the Cartesian product of these sets, Note that X consists of all points $(x_i)_{i \in \Lambda}$, where $x_i \in X_i$. Recall that, for each $i \in \Lambda$, we define the projection π_i from the product set X to the coordinate space, i.e. by $\pi_i(x_i) = x_i$. These projections are used to define the product topology (Lipschutz 1965).

Definition: Let $\{X_i, i \in \Lambda\}$ be a family of nonempty sets. Let τ_i be the usual product of τ_i 's and let π_i be the projection from X into X_i . Further assume that each X_i is a fuzzy topological space with fuzzy topology τ_i . Now, the fuzzy topology generated by $\{\tau_i, i \in \Lambda\}$ as a sub basis, is called the product fuzzy topology on X . Clearly if w is a basis element in the product, then there exist U_i , with $\pi_i(U_i) = w_i$ such that (Wong 1974).

Definition: Let f be a real valued function on a topological space. If U_α is open for every real α , then f is called lower semicontinuous function (Rudin 1966).

Definition: Let X be a nonempty set and T be a topology on X . Let ω be the set of all lower semi continuous functions from (X, T) to I (with usual topology). Thus ω for each $\alpha \in I$. It can be shown that $\omega(T)$ is a fuzzy topology on X (Lowen 1976).

Let P be the property of a topological space (X, T) and FP be its topological analogue. Then FP is called a 'good extension' of P if and only if the statement (X, T) has P if and only if FP holds good for every topological space (X, T) .

Definition: The initial fuzzy topology on a set X for the family of fts $\{X_i, \tau_i, i \in \Lambda\}$ and the family of functions $\{\pi_i, i \in \Lambda\}$ is the smallest fuzzy topology on X making each π_i fuzzy continuous. It is easily seen that it is generated by the family $\{\pi_i^{-1}(U_i), i \in \Lambda\}$ (Lowen 1977).

Definition: The final fuzzy topology on a set X for the family of fts $\{X_i, \tau_i, i \in \Lambda\}$ and the family of functions $\{\pi_i, i \in \Lambda\}$ is the finest fuzzy topology on X making each π_i fuzzy continuous (Lowen 1977).

Theorem: A bijective mapping from an fts (X, τ) to an fts (Y, s) preserves the value of a fuzzy singleton (fuzzy point). Note: Preimage of any fuzzy singleton (fuzzy point) under bijective mapping preserves its value (Amin *et al.* 2014).

THE MAIN RESULTS

In this section, we discuss about our notions and findings. Some well-known properties are discussed here by using our concepts.

Definition: A fuzzy topological space is called

if and only if for any pair with, there exists such that, and

if and only if for any pair with, there exists such that, and.

(c) if and only if for any pair with, there exists such that, and (Srisvastava *et al.* 1981).

Theorem: For a fuzzy topological space the following implications are true:

, . But in general the converse is not true.

Proof of Let be a fuzzy topological space and is. We have to prove that is. Let be fuzzy points in X with. Since is F fuzzy topological space, we have, there exists such that and. To prove is, it is only needed to prove that.

Now, . It follows that there exists such that, and. Hence it is clear that is.

To show is is, we give a counter example.

Counter-example: Let and be given by, , , . Let us consider the fuzzy topology on generated by. For, and, . Now, and. But. Hence it is clear that is but is not.

Proof of: Let be a fuzzy topological space and is. We have to prove that is. Let be fuzzy points in X with. Since is F fuzzy topological space, we have, there exists such that and. To prove is, it is only needed to prove that, and. Now, , for any. Similarly, . Hence it is clear that is.

To show is is, we give a counter example.

Counter-example:

Let and be given by, and, , where for and Let us consider the fuzzy topology on generated by. Then, . Similarly, . Hence it is clear that is. But and. Thus is not.

Proof of: Let be a fuzzy topological space and is. We have to prove that is. Let be fuzzy points in X with. Since is F fuzzy topological space, we have, there exists such that and. To prove is, it is only needed to prove that, and. Now, , for any. Similarly, .

Also, $=0=0=0$

. Hence it is clear that is.

To show is is, we give a counter example.

Counter-example:

Let and be given by, and, , where for Let us consider the fuzzy topology on generated by. Then, . Similarly, . Also, i.e.. Hence it is clear that is. But, and $0 \neq 0$. Thus is not. This completes the proof.

Now we shall show that our new notions satisfy the good extension property.

Theorem: Let be a fuzzy topological space. Consider the following statements:

(1) (X, τ) be a topological space.

(2) (X, τ) be an \mathcal{F} space.

(3) (X, τ) be an \mathcal{F} space. Then these implications are true: (1) \Rightarrow (2), (2) \Rightarrow (3), (3) \Rightarrow (1).

Proof of (1) \Leftrightarrow (2): Let (X, τ) be a topological space and (X, τ) is \mathcal{F} . We have to prove that (X, τ) is \mathcal{F} . Let x, y be fuzzy points in X with $x \neq y$. Since (X, τ) is topological space, we have, there exists U, V such that $x \in U$ and $y \in V$. From the definition of lower semi continuous we have $U \cap V = \emptyset$. Then $x \in U \cap V = \emptyset$. Similarly, $y \in U \cap V = \emptyset$. Also, If $x \in U \cap V$ then there exists z in X such that $x = z = y$, a contradiction. So, $U \cap V = \emptyset$. It follows that there exists U, V such that $x \in U$ and $y \in V$ and $U \cap V = \emptyset$. Hence (X, τ) is \mathcal{F} . Thus holds.

Conversely, (X, τ) be a fuzzy topological space and (X, τ) is \mathcal{F} . We have to prove that (X, τ) is topological space. Let x, y be points in X with $x \neq y$. Since (X, τ) is topological space we have, for any fuzzy points x, y in X , there exists such that $x \in U$ and $y \in V$ and $U \cap V = \emptyset$.

Now, (X, τ) is \mathcal{F} .

Similarly, (X, τ) is \mathcal{F} . Also,

Again, (X, τ) is \mathcal{F} . We claim that For, if (X, τ) is \mathcal{F} , then (X, τ) is topological space, a contradiction. Thus,

It follows that (X, τ) is topological space. Hence, (X, τ) is topological space. Thus holds. Similarly, we can prove that (X, τ) is \mathcal{F} .

Now we shall show that our new notions satisfy the hereditary property.

Theorem: Let (X, τ) be a fuzzy topological space, (X, τ) is \mathcal{F} , then

(a) (X, τ) is \mathcal{F} and

(b) (X, τ) is \mathcal{F} .

Proof of (b) : Let (X, τ) be a fuzzy topological space and (X, τ) is \mathcal{F} . We have to prove that (X, τ) is \mathcal{F} . Let x, y be fuzzy points in A with $x \neq y$. Since, these fuzzy points are also fuzzy points in X . Also since (X, τ) is fuzzy topological space, we have, there exists U, V such that $x \in U$ and $y \in V$ and $U \cap V = \emptyset$. For (X, τ) is \mathcal{F} , we have $U \cap V = \emptyset$.

Now, (X, τ) is \mathcal{F} . Similarly, (X, τ) is \mathcal{F} . And. It follows that there exist U, V such that $x \in U$ and $y \in V$ and $U \cap V = \emptyset$. Hence, (X, τ) is \mathcal{F} . Similarly, we can prove (b).

Now we shall show that our new notions satisfy the productive and projective property.

Theorem: Let (X, τ) be fuzzy topological spaces and (X, τ) be the product topology on X , then

(a) for all (X, τ) is \mathcal{F} if and only if (X, τ) is \mathcal{F} and

(b) for all (X, τ) is \mathcal{F} if and only if (X, τ) is \mathcal{F}

Proof of (a): Let for all (X, τ) is \mathcal{F} space. We have to prove that (X, τ) is \mathcal{F} . Let x, y be fuzzy points in X with $x \neq y$. Then x, y are fuzzy points with $x \neq y$ for some x, y . Since (X, τ) is \mathcal{F} , there exists U, V such that $x \in U$ and $y \in V$ and $U \cap V = \emptyset$. Now, (X, τ) is \mathcal{F} .

But we have and .

Now,

. Similarly, we can prove that .

Also,

. Hence, It follows that there exists such that and

Hence it is clear that is.

Conversely, Let be a fuzzy topological space and is . We have to prove that . Here let us consider, be a fixed element in . Let

Then is a subset of , and hence is a subspace of . Since is , so is . Now we have is homeomorphic image of . Hence it is clear that for all is space. Thus (a) holds. Similarly, we can prove (b).

Theorem: Let (X, t) and (Y, s) be two fuzzy topological spaces and be a one-one, onto and fuzzy open map then

and

Proof of (a): Let be a fuzzy topological space and is . We have to prove that is . Let be fuzzy points in Y with $x \sqsubseteq y$. Since f is onto then there exist with , and , are fuzzy points in X with as f is one-one. Again since (X, t) is $F(i)$ space, there exists $u, v \in t$ such that and u . Now, and, Now, } for some x } for some y . Also we have, f is a fuzzy open mapping. Then .

Again, and . Also, u Now,

$f(u) f(u)$ and

$f(u) f(u)$.

Therefore, $f(u) f(u)$. It follows that there exists such that and $f(u)$. Hence it is clear that is space. Similarly, we can prove (b).

Theorem: Let (X, t) and (Y, s) be two fuzzy topological spaces and $f: X \rightarrow Y$ be a one-one, onto and fuzzy continuous mapping then,

(a) and

(b) .

Proof of (b): Let (Y, s) be a fuzzy topological space and (Y, s) is $F(ii)$. We have to

prove that is . Let be fuzzy points in X with . Then are fuzzy points in Y with as f is one-one. Again since is space, there exists such that . Now, . Similarly, we can prove that . Also

Now since, is fuzzy continuous mapping and then . It follows that there existssuch that and . Hence it is clear that is space. Similarly, we can prove (a).

As our next work, here we introduce two theorems on the second notion of us. The idea of these theorems are taken from Amin (2016).

Theorem: If is a family of fts and , a family of one-one and fuzzy continuous functions, then the initial fuzzy topology on X for the family is .

Proof: Let t be the initial fuzzy topology on X for the family . Let be fuzzy points in X with . Then $(x), (y)$ and $(x)(y)$ as is one-one. Since is , then for every two distinct fuzzy points , in , there exist fuzzy sets , such that q , and . Now, q and . That is and That is and Also, . That is . That is This is true for every . So \inf , \inf and \inf . Let $u = \inf$ and $v = \inf$. Then u as is fuzzy continuous. So, $v(y)+s > 1$ and . Hence, , and . Therefore, (X, t) is

Theorem: If is a family of fts and , a family of fuzzy open and bijective function, then the final fuzzy topology on X for the family is .

Proof: Let t be the final fuzzy topology on X for the family . Let be fuzzy points in X with . Then $(x), (y)$ and $(x)(y)$ as is bijective. Since is , then for every two distinct fuzzy points , in , there exist fuzzy sets , such that q , and . Now, q and . That is and That is and Also . That is That is This is true for every . So \inf , \inf and Let $u = \inf$ and $v = \inf$. Then u, v as is fuzzy open. So, , $u(y)+s > 1$ and . Hence, , and . Therefore, (X, t) is
