Prevention of Breast Cancer by Breast Self-Examination

Negar Fouzia¹

Breast cancer is one of the most common cancers among females worldwide. Global statistics show the annual incidence of breast cancer is increasing and this is occurring more rapidly in countries with a low incidence rate of breast cancer (Parkin et al., 2005). Although breast cancer usually develops after the age of 45, the age of onset is decreasing and more young women than ever are affected (Fry and Prentice-Dunn 2006). Young women's cancers are generally more aggressive and result in lower survival rates, making early detection even more important (Ludwick and Tanya 2001).

Promotion of self-care, an attitude fostered early in life may pay lifelong dividends. The adolescent period is a time of rapid change that provides teaching opportunities for shaping health behaviors into adulthood. For example, teaching breast self-care may encourage positive behaviors such as performing breast self-examination (BSE) and seeking regular professional breast examinations. Breast cancer is the most common female cancer worldwide representing nearly a quarter (23%) of all cancers in women. The global burden of breast cancer is expected to cross 2 million by the year 2030, with growing proportions from developing countries (Madanat and Merrill 2002). Globally, cancer is one of the top ten leading causes of death and it is estimated that 7.4 million people died of cancer in 2004 and, if current trends continue, 83.2 million more will have died by 2015; however, among women, breast cancer is the most common cause of cancer mortality, accounting for 16% of cancer deaths in adult women (Porter 2008).

Health behaviors such as BSE can help empower women to take some control and responsibility over their health promotion. For younger women, BSE education and adherence are a gateway to health promotion behaviors which set the stage for adherence to clinical breast examination and mammography screening later in life. Although the value of BSE is controversial (McCready et al., 2005), American Cancer Society recommends as an option breast awareness and BSE for early detection of breast cancer. It benefits women in two ways: women become familiar with both the appearance and the feel of their breasts and detect any changes in their breasts as early as possible. BSE makes women more "breast aware", which in turn may lead to an earlier diagnosis of breast cancer. The rationale behind extending BSE practice as a screening test is the fact that breast cancer is frequently detected by women themselves without any other symptoms¹¹.

Breast cancer is a major life-threatening public health problem of great concern (Soyer et al., 2007). If rural women's knowledge towards breast cancer and its screening is remarkable, it lets health policy makers strengthen the trend being taken, but if the reverse occurs the finding will serve as a source for health policy planners to design strategy that can reshape and fill the gap. In addition the result will have direct implication to the growth of nursing profession towards early detection and prevention of complication. Furthermore to appreciate the nurse's stand to this world warning issue and to equip them based on the identified gaps as to that they can be able to manage problems of the community they serve. Several studies have reported that breast cancer is the most common cancer and principal cause of cancer deaths in women and is therefore a world concern (Dündar et al., 2006; McCready et al., 2005). Education about the importance of early detection in decreasing mortality rates might be of value in raising awareness of the various methods of early detection of breast cancer. More research is also needed to identify the underlying

variables that might influence nurses' own practice of early detection methods of breast cancer. Empowering nurses with information about early detection methods and their related benefits could help in advancing their skills in performing breast self-examination and expanding their role as client educators.
